

A 63mm distribution box is sufficient

Overview

Smaller pipe diameters such as 63 mm are ideal for hiding in ceilings between floors or in areas with dropped ceilings, and are well-suited for spaces where airflow requirements are lower, such as toilets and walk-in wardrobes. A distribution box, also known as a fuse box or power distribution box, is the heart of the domestic electrical installation. It is used to distribute the electricity supplied by the energy supplier to the various circuits within a building. Different environments, power needs, and operational factors all play a role in determining which distribution box will best meet the requirements.
