

Connecting the optical splitter to the fiber optic link

Overview

The installation of optical splitters is a straightforward process that can be completed in a few simple steps. Next, connect the main fiber line from the control center to the input port of the. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. They are crucial for network expansion, especially in scenarios where multiple locations need to be.
