Overview

Except for hydroelectric generation, which is almost totally owned and operated by the public company CEL (Comisión Hidroeléctrica del Río Lempa), the rest of the generation capacity is in private hands. Electricity can be generated in two main ways: by harnessing the heat from burning fuels or nuclear reactions in the form of steam (thermal power) or by capturing the energy of natural forces such as the sun, wind or moving water. El Salvador provides a fantastic case study into the energy sector and how size is not necessary to promote transitions to renewable energy. The renewable energy sector in El Salvador has experienced significant growth in recent years, positioning the country as a regional leader in the transition towards cleaner and more sustainable energy sources. According to recent data, approximately 70% of the energy generated in El Salvador comes from renewable sources. The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the world measured at a height of 100m.
