

General-purpose Electronystagmography

Overview

Electronystagmography (ENG) is a diagnostic test to record involuntary movements of the eye caused by a condition known as. It involves placing small metal discs (electrodes) around your eyes, which measure nerve function. It can also be used to diagnose the cause of vertigo, dizziness or balance dysfunction by testing the vestibular system.

Chapter 4 Electronystagmography and Videonystagmography

Introduction Vestibular function tests are clinical techniques used to evaluate part of the vestibular system. Stimulation of the inner ear results in specific eye movement termed nystagmus, which are

Electronystagmography

Electronystagmography (ENG) is a diagnostic test to record involuntary movements of the eye caused by a condition known as nystagmus. It can also be used to diagnose the cause of vertigo, dizziness or balance dysfunction by testing the vestibular system.

Electronystagmography is used to assess voluntary and involuntary eye movements. It evaluates the cochlear nerve and the oculomotor nerve (CN III). The ENG can be used to determine the origin of various eye and ear disorders.

Electronystagmography (ENG)

Electronystagmography (ENG) detects involuntary rapid eye movement known as nystagmus and evaluates people with vertigo and other hearing and eye disorders.
