

High Temperature Resistance Solution for Greek Power Storage Cabinets

Overview

EPDM (Ethylene Propylene Diene Monomer) sealing strips are used, with a temperature resistance range of -50°C to 150°C and a compression rebound rate of $\geq 80\%$. They maintain sealing performance for a long time, preventing the intrusion of humid and hot air. High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat. Four Core Threats of High-Temperature Environments: KDST's In-Depth Insights from Practical Cases Based on its service experience in typical high-temperature scenarios such as Middle Eastern deserts, Southeast Asian tropical factories, KDST has summarized four key impacts of high temperatures on. Heat dissipation challenges related to energy storage cabinets encompass various critical aspects that can significantly impact performance and longevity. Suitable insulation material and thickness act like an "intelligent thermal regulation system" for the cabinet, safeguarding battery health and efficiency through harsh winters and scorching summers. According to the Greek National Energy and Climate Plan (NECP), the nation aims to install 4.
