

# **KD in the distribution box**

## Overview

---

The distribution constant (or partition ratio) (KD) is the for the distribution of an in two. The calculation of Kd is concentration on the solids (mg kg<sup>-1</sup> dry solid) divided by concentration in the pore water (mg L<sup>-1</sup>), giving units of L kg<sup>-1</sup>. How do you find the distribution coefficient in chemistry?

## Distribution constant

The distribution constant (or partition ratio) (KD) is the equilibrium constant for the distribution of an analyte in two immiscible solvents. In chromatography, for a particular solvent, it is equal to the ratio of its molar concentration in the stationary phase to its molar concentration in the mobile phase, also approximating the ratio of the solubility of the solvent in each phase.

## How to calculate KD in organic chemistry?

The distribution coefficient (KD) in organic chemistry is calculated by dividing the solute's concentration in the organic phase by its concentration in the aqueous phase at equilibrium.
