

# Mobile network fiber optic cable

## Overview

---

Fiber-optic cable: Made of ultra-thin strands of glass, the fiber-optic cable carries data as light pulses rather than electrical signals. This light-based transmission allows for faster speeds, greater reliability, and minimal signal loss compared to traditional copper cables. Many different components are used for connections in mobile communication networks: from coaxial connectors, jumper cables and surge protection to RJ45 plugs, patch cables, FO connectors and cables. A fiber cable (drop) is run from a nearby terminal (that could be either a pole or an underground box) to your home. There are different types of fiber optic cables because each type is optimized for specific applications that have unique requirements for bandwidth, transmission distance, and environmental factors.
