

NRZ output of optical receiver

Overview

Generally, the level changes that occur in a PCM transmission are used to keep the receiver clock synchronized to the transmitter. Abstract— We present a comprehensive treatment of optically preamplified direct detection receivers for non-return-to-zero (NRZ) and return-to-zero (RZ) on/off keying modulation, taking into account the influence of different (N)RZ optical pulse shapes, specified at the receiver input, and filter. In this section, we will explore the definition, basic principles, historical context, and importance of NRZ encoding in modern optical networks.
