

Secondary Distribution Box EOP

Overview

The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. High-quality materials and robust product designs ensure a reliable connection, signal transmission and power. A major focus on the development of efficient electrical grid structures of aircrafts is the design of the power supply of loads in the cabin.
