

Stabilizing the side of the terminal box

Overview

This is achieved by removing the receptacle device and driving a longer screw at an angle through the side of the box and into the adjacent stud. If your panel's circuits are not clearly labeled, take the time to identify and label them correctly for future reference. I have an old 3-gang metal junction box that is nailed to a stud on one side, via the "new work" straps above and below it. No other part of it is fixed to anything, and it has become a little loose over the years (or perhaps it always was) so the opposite side rocks in and out of the wall slightly. The terminal box components within STAMFORD and AvK alternators include a variety of copper bars, which interconnect the stator winding electrical terminals. Each copper bar has been duly designed to meet engineering requirements for the prevailing operating levels with regard to current density.
