This visual coding system helps electricians and technicians quickly identify different circuits, such as protective earth. Looking at some terminal blocks like the one below, why are the top level positions color coded blue while the middle ones are in grey?

I understand yellow-green are for ground connections. I am guessing Blue is for DC, but can't figure out what grey is usually meant for. Reading terminal block markings sounds simple—until you're assembling a panel that must pass both UL and IEC inspections.
