Overview

At its simplest, a pigtail connector is a connectorized stub cable: one end comes pre-terminated with a specific connector (RF, fiber, or electrical), and the other end is left unterminated (bare wires, optical fibers, or stripped conductors). End gateways are intradimensional portals generated in the End: some are spawned around the central island after each death of the ender dragon; others are randomly generated throughout the outer islands. Pigtailling is the "better" method if time is not a factor, you can make a good splice, and you have some spare wire of the appropriate gauge to make pigtails with. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. But now I find that my 3 port command link plus bus has no open spots to plug in the gateway pigtail.
